	* D ₄ = 3.268 for 2 trials and 2.574 for 3 trials. UCL _R represents the limit of individual R's. Circle those that are beyond this limit. Identify the cause and correct. Repeat these readings using the same appraiser and unit as originally used or discard values and re-average and recompute and the limiting value from the remaining observations.											

Table 1 Measurement data, averages, range and limits

UCL_R represents the upper limit of individual Ranges (R). Causes for ranges beyond this limit are identified and following action taken. Repeat readings using the same appraiser and unit as originally used or Discard > limit values and re-compute Average and R and limiting values from remaining observations.

Table 2 Calculation of Gage R&R

Gage R&R acceptance guide lines provided by AIAG are as follows:

- % R&R 10% - Gauge System Okay (Most variation caused by parts, not people or equipment).
- % R&R > 10% but < 30% - May be acceptable based on importance of application and cost of gauge or repair.
- % R&R > 30% - Gauge system needs improvement (People and equipment cause over 1/3 of variation).
